WHAT IS CLAIMED IS:

- 1. A user installation for interfacing a television or like device with a video broadcast multi-channel feed signal, the installation comprising:
- a connector for connection to a video broadcast multi-channel feed receiver installation,
- a splitter unit attached to said connector for splitting incoming signals from said connector into a video feed signal and a signal received from a terrestrial network, and for directing outgoing signals for said terrestrial network to said connector,

said terrestrial network signal providing a return link to support user interaction from said interfaced device.

- 2. The user installation of claim 1, wherein said video broadcast multichannel feed signal comprises a satellite signal.
- 3. The user installation of claim 1, wherein said video broadcast multichannel feed signal comprises a terrestrial signal.
- 4. The user installation of claim 1, further operable to provide wide area network (WAN) support so that said connected satellite TV installation, when supplied with a terrestrial antenna, can serve as a WAN node.
- 5. The user installation of claim 4, wherein said WAN support substantially fulfils the requirements of IEEE standard 802.16 or the requirements of IEEE standard 802.20.
- 6. The user installation of claim 1, further operable to provide Hotspot support so that said connected satellite TV installation, when supplied with a terrestrial antenna, can provide a local hotspot.
- 7. The user installation of claim 6, wherein said hotspot support substantially fulfils the requirements of IEEE standard 802.11.

- 8. The user installation of claim 1, comprising set top box (STB) functionality, WAN functionality, and splitter combiner functionality.
- 9. The user installation of claim 1, further comprising a residential gateway comprising interface functionality for at least one of a LAN, an Internet enabled device, and a voice over IP enabled device.
- 10. The user installation of claim 9, wherein said residential gateway and a set top box functionality are integrated within a single housing.
- 11. The user installation of claim 8, further comprising hotspot management functionality.

5

- 12. The user installation of claim 8, comprising master STB functionality for connecting a plurality of set top boxes.
 - 13. The user installation of claim 1, comprising residential gateway functionality with local area network (LAN) support for supporting a plurality of household communication enabled devices over a LAN.
 - 14. The user installation of claim 13, wherein said LAN support comprises Ethernet support.
 - 15. The user installation of claim 13, wherein said LAN support is over a co-ax cable.
 - 16. The user installation of claim 13, wherein said LAN support comprises wireless network support.
 - 17. The user installation of claim 1, wherein said connector is adapted to use an existing co-ax cable or a twisted pair for sending outgoing signals.

18. The user installation of claim 1, wherein said connector is adapted to use Ethernet for sending outgoing signals.
